## **SN Discovery Tool v1.07**

## **Installing and using on Windows XP:**

The Windows Firewall must be **disabled** for the tool to work. Administrative rights are required to run the tool.

## **Installing and using on Windows 7:**

The Windows Firewall must be **enabled** for the tool to work. You will also need to change the settings in the application properties as seen below. (Run program in Windows XP (Service Pack 3) compatibility Mode and set the Privilege Level to Run as Administrator.)

For computers running virtual box using a "Virtual Host-Only Network" with a network-adapter installed, the SN-Discovery tool will not work (no SN's will be displayed). By disabling this, it will then work as expected.
